

## Presto vs Hive: Conclusion

Many professionals (who work with big data) prefer **Hive** (over Presto) because they appreciate its "stability" and flexibility. (When you work with big data professionally,) you find times (when you want to write custom code that will make projects more efficient.)

Just because some people prefer Hive, doesn't necessarily mean that you should discount Presto. It works well when used as intended. **Presto** processes tasks quickly. Just don't ask it to do too much at once. If you do, you run the risk of failure.
